

S-TSCC is the Herschel Touch Screen Control Centre. This is a hard-wired device that acts as a central control centre where you can control all of your thermostats* in the building.

TSCC is designed to operate with Smart Life Tap-to-Run Scenes, which wirelessly control your thermostats based on a scenario you can create in Smart Life. For example, if you set up a 'Holiday Mode' Scene, then you can simply tap this Scene from the TSCC and this will automatically set all thermostats to run at the designated temperature while you are away, saving energy by ensuring you never heat an empty home. You can access up to 100 Scenes on the TSCC.

S-FSC is the Herschel Four Scene Control. This allows you to assign any 4 Tap-to-Run Scenes to the device for quick and convenient control of your heating. From this device, you can assign any Scene to any button, as a guide we recommend (going clockwise from top left) 'On', 'Off', 'Custom', and 'Holiday Mode'.

However, you can assign any Tap-to-Run Scene to any button to customise the device to your schedule and your heating routine.

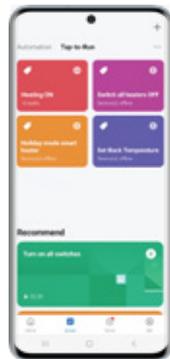

S-HSS is the Herschel Smart Switch. This can be used as a directly wired on/off switch for the Herschel HydroNova, or for any other appliance. This is a 20 Amp switch and can be switched on or off either by tapping the button on the device, or through the Smart Life app.

Alternatively, the Smart Switch can be used to activate one Tap-to-Run Scene. An example of how this may be used could be as a Boost button, to increase the temperature of any selected room. Or this can be used to turn your heating off. You can add delays or countdowns on the Smart Life App.
